N'terminally truncated monocyte chemo:attractant protein-1 (MCP-1) -
lacks MCP-1 activity and inhibits receptor binding, useful as
lacks MCP-1 activity and inhibits receptor binding, useful as
anti-inflammatory agent
bisclosure: Page 5: 27pp; English.
The present sequence represents an analogue, which lacks the
chemoattractant protein-1 (MCP-1). The analogue, which lacks the
N-terminal amino acids 1-10 of MCP-1, acts as an antagonist of MCP-1
as it lacks MCP-1 biological activity and inhibits binding to a MCP-1
creceptor. The analogue is useful as an anti-inflammatory agent to block
the effects of MCP-1 which is an inflammatory mediator causing migration
of monocytes and other cells e.g. basophils and lymphocytes into
inflammatory diseases. G. arthritis, arteriosclerosis and several lung
diseases. The analogue competes more effectively with MCP-1 for binding
mCP-1 receptors than prior art mutant versions of MCP-1 e.g. preferably
with 75:1 for prior art mutant 7ND.

N-terminally truncated monocyte chemo:attractant protein-1 (MCP-1) -
lacks MCP-1 activity and inhibits receptor binding, useful as
anti-inflammatory agent
Claim 7; Page 5: 27pp; English.
The present sequence represents an analogue, MCP-1 (9-76), of monocyte
chemoattractant protein-1 (MCP-1). The analogue, which lacks the

PER MOLINE By. Zanang YJ;

Human monocyte chemo-attractant protein-1 (MCP-1) derivs. - are
reapable of inhibiting the monocyte chemo-attractant activity of
endogenous MCP-1 and can be used to treat restenosis

Claim 4; Page 11; 22pp; English.

Claim 4; Page 11; 22pp; English.

Claim 4; Page 11; 22pp; English.

Composete chemoattractant protein-1 (MCP-1) derivatives are mutated such
that they inhibit the monocyte chemoattractant activity of endogenous

MCP-1, provided that the derivative has not been modified by the
that they inhibit the monocyte chemoattractant activity of endogenous

MCP-1, provided that the derivative has not been modified by the
that they inhibit the monocyte chemoattractant activity of endogenous

MCP-1, provided that the derivative has not been modified by the
that they inhibit the monocyte chemoattractant activity of endogenous

MCP-1, provided that the derivative has not been modified by the
substitution of 28 Tyr by aspartate; (2) substitution of 24 Arg

DY Phe; (3) substitution of 3-Ryp by Ala; and/or (4) debetion of amino
acids 2-8. The present sequence is a specifically claimed human MCP-1

derivative based on the parent protein disclosed in Rollina; Molecular
and Cellular Biology, Vol. 9, No. 11, pp. 4687-4655, Nov. 1999.

The peptides can be used to prevent restenosis, e.g. in patients
undergoing coronary artery angioplasty.
N-terminal amino acids 1-8 of MCP-1, acts as an antagonist of MCP-1 receptor. The analogue is useful as an anti-inflammatory agent to block the effects of MCP-1 which is an inflammatory mediator causing migration of monocytes and other cells e.g. basophils and lymphocytes into inflammatory attes. MCP-1 has been implicated in allergic and chronic inflammatory diseases e.g. arthritis, arteriosclerosis and several lung diseases. The analogue competes more effectively with MCP-1 for binding MCP-1 receptors than prior art mutant versions of MCP-1 e.g. preferably with 75:1 for prior art mutant 7ND.
                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

Mean 23.018; Variance 24.711; scale 0.932 Statistics:

pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence represents an analogue, MCP-1 (8-76), of monocyte chemoattractant protein-1 (MCP-1). The analogue, which lacks the chemoattractant protein-1 (MCP-1). The analogue, which lacks the as I lacks MCP-1 biological activity and inhibits bliding to a MCP-1 creeptor. The analogue is useful as an anti-inflammatory agent to block the effects of MCP-1 which is an inflammatory mediator causing migration of monocytes and other cells e.g. basophils and lymphocytes into inflammation sites. MCP-1 has been implicated in allergic and chronic inflammatory diseases e.g. arthritis, arteriosclerosis and several lung diseases. The analogue competes more effectively with MCP-1 for binding MCP-1 receptors than prior art mutant versions of MCP-1 e.g. preferably with 75:1 for prior art mutant 7ND. a 25:1 ratio or less, compared with 75:1 for prior art mutant 7ND.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human monocyte chemo-attractant protein-1 (MCP-1) derivs. - are capable of inhibiting the monocyte chemo-attractant activity of endogenous MCP-1 and can be used to treat restenosis claim 3; Page 11; 22pp; English (MCP-1) derivatives are mutated such monocyte chemoattractant protein-1 (MCP-1) derivatives are mutated such monocyte chemoattractant activity of endogenous MCP-1, provided that the derivative has not been modified by the substitution of 28-ryr by Leu and/or 30-arg by Val. Preferred mutations are: (1) substitution of 28 Tyr by aspartate; (2) substitution of 24 Arg by Phe; (3) substitution of 3-Asp by Ala; and/or (4) deletion of amino activi. 2-8 The present sequence is a specifically claimed human MCP-1 derivative based on the parent protein disclosed in Rollins, Molecular

                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                            28-0AN-1993 (first entry)
28-0AN-1993 (first entry)
Seguence of bovine P6 protein.
Monocyte chemottractant; bovine P6-derivative; thrombosis; tumour; inflammation therapy.
and Cellular Biology, Vol. 9, No. 11, pp. 4687-4695, Nov. 1989. The peptides can be used to prevent restenosis, e.g. in patients undergoing coronary artery angioplasty.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   protein; antisense; inhibition;

Monocyte chemoattractant protein-1 (MCP-1) derivatives are mutated such that they inhibit the monocyte chemoattractant activity of endogenous MCP-1, provided that the derivative has not been modified by the substitution of 28-Tyr by Leu and/or 30-Arg by Val. Preferred mutations are: (1) substitution of 28 Tyr by aspartate; (2) substitution of 24 Arg are: (1) substitution of 3-Asp by Ala; and/or (4) deletion of amino derivative based on the parent protein disclosed in Rollins, Molecular and Callular Biology, Vol. 9, No. 11, pp. 4687-4695, Nov. 1989.

The peptides can be used to prevent restenosis, e.g. in patients
                                                                        Anti-sense Monocyte Chemotactic Protein-1 oligo:nucleotide(s) -
useful for therapy or diagnosis of restenosis, etc.
Useful for therapy or diagnosis of restenosis, etc.

Disclosure: Column 13-14; 16pp; English.

This is the amino acid sequence of the human monocyte chemoattractant
protein (MCP)-1, a member of the C-C chemokine family. MCP-1 is a potent
stimulator of monocyte chemotaxis and is produced by injured vascular
smooth cells thus attracting monocytes. This causes proliferation of
the injured area and release growth factor. This causes proliferation of
the vascular smooth cells resulting in restenosis. The gene sequence can
be used to generate antisense sequences e.g. 148093-7, which can be used
to inhibit in vitro MCP-1 prodn. by monounclear cells e.g. lymphocytes or
macrophages, or smooth muscle cells, esp. in order to prevent vascular

Peptide is derived from glioma cell line U-105MG (ATCC CRL9932) or from leukocytes and has mol. wt. 8400. Used to treat infections and neoplasms. Sequence 76 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Macrophage chemoattractant peptide designated GDCF-2.
Macrophage chemoattractant peptide MCP; MCP-1; treatment; neoplasm; infection; human; monocyte receptor; chemotactic response; inflammation; monocyte infiltration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a monocyte chemoattractant peptide (MCP) designated GDCF-2. MCPs can be isolated from human glioma cell line U-105MG (e.g. present sequence) and peripheral blood mononuclear leukocytes. MCPs are used for the treatment of neoplasms and infections in humans. Short peptides derived from MCPs can be screened to identify chance that can bind to the monocyte receptor without stimulating a chamber of the mass of the period of the monocyte receptor without stimulating a inflammation associated with monocyte infiltration.
                                                                                                                                                                                                                                                                                                                                                                      New peptide with specific chemotactic activity for monocytes - isolated from glioma or leucocyte cells, useful for treating infections and

Preferred mutations capable in Substitution of 28 Tyr by aspartate: (2) substitution of 24 Arg are: (1) substitution of 28 Tyr by aspartate: (2) substitution of 24 Arg are: (1) substitution of 3-Asp by Ala; and/or (4) deletion of amino caids 2-8. The present sequence is a specifically claimed human MCP-1 caids 2-8. The present sequence is a specifically claimed human MCP-1 and Cellular Biology, Vol. 9, No. 11, pp. 4687-4695, Nov. 1989.

The peptides can be used to prevent restenosis, e.g. in patients cundergoing coronary artery angioplasty.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Wound treatment using monocyte chemotactic factor - has potent therapeutic effect on skin wounds and ulcers
Disclosure; Page 12; Jappi Japanese.
The invention relates to a new remedy for curing wounds which, instead of comprising a growth factor, comprises a monocyte chemotactic activating factor (MCAF) or its variants or derivatives. The factor has
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

CC oligonuclectides may be labelled with a radionuclide and use CC therapeutically for the treatment of vascular restenosis.

CC Radiolabelled antisense MCP-1 compounds may be constructed using high control of the compounds may be constructed using high compounds inactivate MCP-1 compounds. Antisense MCP-1 compounds inactivate MCP-1 or inhibit production of MCP-1 or compounds inactivate MCP-1 or inhibit production of MCP-1 so that cc monocytes are not attracted to the area of vascular injury and cc monocytes are not attracted to the area of vascular injury and cc proliferation of vascular cells is inhibited.

CC Proliferation of vascular cells is inhibited.

Human monocyte chemo-attractant protein-1 (MCP-1) derivs. - are capable of inhibiting the monocyte chemo-attractant activity of endogenous MCP-1 and can be used to treat restenosis claim 3; Page 11; 22pp; English.

Claim 3; Page 11; 22pp; English.

Monocyte chemoattractant protein-1 (MCP-1) derivatives are mutated such that they inhibit the monocyte chemoattractant activity of endogenous MCP-1, provided that the derivative has not been modified by the substitution of 28-Tyr by Lea and/or 30-Arg by val. Preferred mutations are: (1) substitution of 28 Tyr by aspartate; (2) substitution of 24 Arg by Phe; (3) substitution of 24 Arg by Phe; (3) substitution of 3-Asp by Ala; and/or (4) deletion of amino acids 2-8. The present sequence is a specifically claimed human MCP-1 derivative based on the parent protein disclosed in Rollins, Molecular 'note- "Tyr in the native sequence is replaced by Asp" 0; Gaps monocyte chemoattractant protein; MCP-1; mutant; restenosis; .06e-01; ... 0; Indels Pred. Poly(A+)RNA from bull seminal vesicles was used to prepare a cDNA in the expression vector lambdd gill. 1.5 x 10(5) cDNA clones were screened with a polyclonal anti-P6 antiserum of monospecific immunoglobulin G and six positives were identified. The insert of a sultable cDNA clone, pH42, was cloned into pUC18 and sequenced. pH42 encodes the 11,114 Da precursor of P6. It is called Monocyte Chemoattractant (bMCP-1), which is a homologue of human (h)MCP-1. There is 72% overall AA sequence homology to hMCP-1 with the signal peptide showing 100% and the central region showing 89% homology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                         28-JAN-1993 (first entry)
Sequence of bovine P6 protein.
Monocyte chemoattractant; bovine P6-derivative; thrombosis; tumour;
                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Drug containing a bovine protein homologous to human MCP-1 · for treating inflammation, tumours, thrombosis, and immune reactions, also for diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Monocyte chemotactic protein 1.

Human; monocyte chemoattractant protein; antisense; inhibition; mononuclear cell; lymphocyte; macrophage; smooth muscle cell; vascular restenosis.
and Cellular Biology, Vol. 9, No. 11, pp. 4687-4695, Nov. 1989. The peptides can be used to prevent restenosis, e.g. in patients undergoing coronary artery angioplasty.

That inflammatory agent

That inflammatory agent inflammatory agent to block

The analogue is useful as an anti-inflammatory agent to block

The analogue is useful as an inflammatory agent to block

The analogue of MCP-1 which is an inflammatory mediator causing migration

The analogue is useful as an inflammatory agent to block

The analogue of MCP-1 has been implicated in allergic and chronic

Inflammatory alseases e.g. arthritis, arteriosclerosis and several lung

Alseases. The analogue competes more effectively with MCP-1 for binding

MCP-1 receptors than prior art mutant versions of MCP-1 e.g. preferably

Claim 1; Pege 3; 6pp; German.
Poly(A+)RNA from bull seminal vesicles was used to prepare a cDNA in Poly(A+)RNA from bull seminal vesicles was used to prepare a cDNA in the expression vector lambda gtil. 1.5 x 10(5) cDNA clones were screened with a polyclonal anti-P6 antiserum of monospecific immunoglobulin G and Six positives were identified. The insert of a put a concess the 11,114 Da precursor of P6. It is called Monocyte Chemoattractant (bMCP-1), which is a homologue of human (h)MCP-1. There is 72% overall Ah sequence homology to hMCP-1 with the signal peptide showing 100% and the central region showing 89% homology.
                                                                                                                                                                                       28-JAN-1993 (first entry)
Sequence of bovine P6 protein.
Monocyte chemoattractant; bovine P6-derivative; thrombosis; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Drug containing a bovine protein homologous to human MCP-1 - for treating inflammation, tumours, thrombosis, and immune reactions, also for diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 84; DB 5; Length 76;

Claim 3: Page 11: 22pp; English.
Monocyte chemoattractant protein-1 (MCP-1) derivatives are mutated such that they inhibit the monocyte chemoattractant activity of endogenous MCP-1, provided that the derivative has not been modified by the substitution of 28-Tyr by Leu and/or 30-Arg by Val. Preferred mutations are: (1) substitution of 28 Tyr by aspartate; (2) substitution of 24 Arg by Pale; (3) substitution of 3-Asp by Ala; and/or (4) deletion of anino acids 2-8. The present sequence is a specifically claimed human MCP-1 derivative based on the parent protein disclosed in Rollins, Molecular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "Tyr in the native sequence is replaced by Asp" 11..36

FEBS LETT. 395:277-282(1996)
-!-FUNCTION: CHEMOTACTIC FACTOR THAT ATTRACTS MONOCYTES AND BASOPHILS
BUT NOT NEUTROPHILS OR EOSINOPHILS. AUGMENTS MONOCYTE ATTI-TUMOR
ACTIVITY. HAS BEEN IMPLICATED IN THE PATHOGENESIS OF DISEASES
CHARACTERIZED BY MONOCYTIC INFILTRATES, LIKE PSORIASIS, RHEUMATOLD
ARTHRITIS OR ATHEROSCIEROSIS. MAY BE INVOLVED IN THE RECRUITMENT
OF MONOCYTES INTO THE ARTERIAL WALL DURING THE DISEASE PROCESS OF
                                                                                                                                                                                                 -1- SUBUNIT: MONOMER OR HOMODIMER; IN EQUILIBRIUM.
-1- PIM: PROCESSING AT THE N-TERMINUS CAN REGULATE RECEPTOR AND TARGET CELL SELECTIVITY: DELETION OF THE AMINO- TERMINAL RESIDUE CONVERTS IT FROM AN ACTIVATOR OF BASOPHIL TO AN EOSINOPHIL CHEMOATTRACTANT.
-1- SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE C-C) (CHEMOKINE CC).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MISSING: 90% REDUCTION IN ACTIVITY.

lipopolysaccharide-stimulated rat macrophages in culture.";
BIOCHEM. BIOPHYS. RES. COMMUN. 220:945-948(1996).
-! FUNCTION: MONORINE WITH INFLAMMATORY AND CHEMOKINETIC PROPERTIES.
HAS CHEMOTACTIC ACTIVITY FOR MONOCYTES, NEUTROPHILS, EOSINOPHILS,
PRODUCTION, NEUTROPHIL RECRUIPMENT AND SUBSEQUENT LUNG INTA ALPHA
MAY FUNCTION AS AN AUTOCRINE MEDIATOR FOR THE MACROPHAGE
ADHESION NOLECLES REQUIRED FOR LUNG THE ACROPHAGE
ADHESION MOLECULES REQUIRED FOR NEUTROPHIL INFLUX. THIS PROTEIN
                                                                                                                                                        INDUCTION: BY LIPOPOLYSACCHARIDE (LPS).
SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE C-C) (CHEMOKINE CC).
                                                                                                                                                                                                                                                                                                                                                                                                                                                          MACROPHAGE INFLAMMATORY PROTEIN 1-ALPHA.

```
The present sequence represents an analogue, MCP-1 (11-76), of monocyte chemoattractant protein-1 (MCP-1). The analogue, which lacks the as chemoattractant protein-1 (MCP-1). The analogue, which lacks the as it lacks MCP-1 biological activity and inhibits binding to a MCP-1 receptor. The analogue is useful as an anti-inflammatory agent to block of monocytes and other cells e.g. basophils and lymphocytes into inflammatory diseases. WCP-1 has been implicated in allergic and chronic inflammatory diseases e.g. arthritis, arteriosclerosis and several lung MCP-1 receptors than prior art mutant versions of MCP-1 for binding providing 50% inhibition of binding at a 25:1 ratio or less, compared
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
